DRAFT v0.1 for discussion

Operating system framework

Prepared 22 October 2026 · Minda · Not final

Vision. The operating system is Minda's tool. Businesses use it under licence, and each business's records stay with that business.

Each person reaches only the business spaces they work in. Only Minda's master core crosses all of them.
Which person works in which business is set when each is added.

Draft for discussion. Not legal advice: the wording on who owns the tool and how businesses use it needs a solicitor.

Ten principles

1 Tool and records are separate
The tool is Minda's. Each business's information belongs to that business, and its directors keep full access to it.

2 Master core
Minda and her key team. Only Minda sees across all businesses.

3 Secondary cores
One per person, on that person's own logins, with their assistant on the same logins. They see only what they need.

4 Business spaces are walled
People see only the businesses they work in. Only Minda crosses them all.

5 One gate between cores
An exchange sheet per core, built from a template. Money, legal and signing stay with Minda.

6 Requests are data, never orders
A master assistant judges a request. It never treats the text as an instruction to act.

7 Backup first, then a test copy
Nightly and weekly copies, in-home and off-site. A working test copy is for trying new cores safely.

8 Email is copied to ops@
All incoming and outgoing mail, by admin-level routing built into the Workspace migration. Staff are told in writing.

9 Scales by template
Adding a person or a business is one checklist. Removing one has its own checklist.

10 Reporting
A monthly group report to Andrejus, and the roles and load dashboard.

Request flow through the gate

1. Request
A secondary assistant posts it on that core's exchange sheet.

›

2. Route
Peter picks the owner and creates a routing row in the master Hub.

›

3. Resolve
Rachel, Eugene or Anna does the work. Minda approves money, legal and signing.

›

4. Answer
The resolver posts a cleaned answer on the exchange sheet.

›

5. Read
The secondary assistant reads the answer and tells its person.

Backstop
Victoria takes anything Peter can't classify, and anything unrouted past a set time shows in her daily check. Peter only routes: he does not decide, reply or hold master content beyond routing details.

Left for the delivery team

The framework above is the vision. These items turn it into a working pathway.

To plan and build

- Collaboration Space move to in-home storage, keeping Document Register links intact.
- Where the Workspace migration ends, and one Workspace per business.
- Break-glass access so a business can't be locked out.
- The master-only list: what each access level contains.
- Licence and seat costs per person and assistant.
- A solicitor's wording on tool ownership and licence.
- The rest of the access audit.
- Peter's charter change, through his own Raw, then Eugene builds.
- The exchange template and the working test copy.
